## 2015 Urban Mobility Scorecard

The national congestion recession is over. Urban areas of all sizes are experiencing the challenges seen in the early 2000s - population, jobs and therefore congestion are increasing. The U.S. economy has regained nearly all of the 9 million jobs lost during the recession and the total congestion problem is larger than the pre-recession levels. For the report and congestion data on your city, see:
http://mobility.tamu.edu/ums.
The data from 1982 to 2014 (see Exhibit 1) show that, short of major economic problems, congestion will continue to increase if projects, programs and policies are not expanded.

- The problem is very large. In 2014, congestion caused urban Americans to travel an extra 6.9 billion hours and purchase an extra 3.1 billion gallons of fuel for a congestion cost of $\$ 160$ billion. Trucks account for $\$ 28$ billion ( 17 percent) of that cost, much more than their 7 percent of traffic.
- From 2013 to 2014, 95 of America's 100 largest metro areas saw increased traffic congestion, from 2012 to 2013 only 61 cities experienced increases.
- In order to reliably arrive on time for important freeway trips, travelers had to allow 48 minutes to make a trip that takes 20 minutes in light traffic.
- Employment was up by more than 500,000 jobs from 2013 to 2014 (1); if transportation investment continues to lag, congestion will get worse. Exhibit 2 shows the historical national congestion trend.
- More detailed speed data on more roads and more hours of the day from INRIX (2) a leading private sector provider of travel time information for travelers and shippers, have caused congestion estimates in most urban areas to be higher than in previous Urban Mobility Scorecards.
The best mobility improvement programs involve a mix of strategies - adding capacity of all kinds, operating the system to get the 'best bang for the buck,' travel and work schedule options and encouraging homes and jobs to be closer. This involves everyone - agencies, businesses, manufacturers, commuters and travelers. Each region should use the combination of strategies that match its goals and vision. The recovery from economic recession has proven that the problem will not solve itself.

## Exhibit 1. Major Findings of the 2015 Urban Mobility Scorecard (471 U.S. Urban Areas) <br> (Note: See page 2 for description of changes since the 2012 report)

| Measures of... | $\mathbf{1 9 8 2}$ | $\mathbf{2 0 0 0}$ | $\mathbf{2 0 1 0}$ | $\mathbf{2 0 1 3}$ | $\mathbf{2 0 1 4}$ |
| :--- | ---: | ---: | ---: | ---: | ---: |
| ... Individual Congestion |  |  |  |  |  |
| Yearly delay per auto commuter (hours) | 18 | 37 | 40 | 42 | 42 |
| Travel Time Index | 1.09 | 1.19 | 1.20 | 1.21 | 1.22 |
| Planning Time Index (Freeway only) | -- | -- | -- | 2.41 |  |
| "Wasted" fuel per auto commuter (gallons) | 4 | 15 | 15 | 19 | 19 |
| Congestion cost per auto commuter (2014 \$) | $\$ 400$ | $\$ 810$ | $\$ 930$ | $\$ 950$ | $\$ 960$ |
| ... The Nation's Congestion Problem |  |  |  |  |  |
| Travel delay (billion hours) | 1.8 | 5.2 | 6.4 | 6.8 | 6.9 |
| "Wasted" fuel (billion gallons) | 0.5 | 2.1 | 2.5 | 3.1 | 3.1 |
| Truck congestion cost (billions of 2014 dollars) | -- | - | -- | $\$ 28$ |  |
| Congestion cost (billions of 2014 dollars) | $\$ 42$ | $\$ 114$ | $\$ 149$ | $\$ 156$ | $\$ 160$ |

Yearly delay per auto commuter - The extra time spent during the year traveling at congested speeds rather than free-flow speeds by private vehicle drivers and passengers who typically travel in the peak periods.
Travel Time Index (TTI) - The ratio of travel time in the peak period to travel time at free-flow conditions. A Travel Time Index of 1.30 indicates a 20 -minute free-flow trip takes 26 minutes in the peak period.
Planning Time Index (PTI) - The ratio of travel time on the worst day of the month to travel time in free-flow conditions. Wasted fuel - Extra fuel consumed during congested travel.
Congestion cost - The yearly value of delay time and wasted fuel by all vehicles.
Truck congestion cost - The yearly value of operating time and wasted fuel for commercial trucks.

Exhibit 2. National Congestion Measures, 1982 to 2014

| Year | Travel Time Index | Delay Per Commuter (Hours) | Total Delay (Billion Hours) | Fuel Wasted (Billion Gallons) | Total Cost (Billions of 2014 Dollars) |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2014 | 1.22 | 42 | 6.9 | 3.1 | \$160 |
| 2013 | 1.21 | 42 | 6.8 | 3.1 | \$156 |
| 2012 | 1.21 | 41 | 6.7 | 3.0 | \$154 |
| 2011 | 1.21 | 41 | 6.6 | 2.5 | \$152 |
| 2010 | 1.20 | 40 | 6.4 | 2.5 | \$149 |
| 2009 | 1.20 | 40 | 6.3 | 2.4 | \$147 |
| 2008 | 1.21 | 42 | 6.6 | 2.4 | \$152 |
| 2007 | 1.21 | 42 | 6.6 | 2.8 | \$154 |
| 2006 | 1.21 | 42 | 6.4 | 2.8 | \$149 |
| 2005 | 1.21 | 41 | 6.3 | 2.7 | \$143 |
| 2004 | 1.21 | 41 | 6.1 | 2.6 | \$136 |
| 2003 | 1.20 | 40 | 5.9 | 2.4 | \$128 |
| 2002 | 1.20 | 39 | 5.6 | 2.3 | \$124 |
| 2001 | 1.19 | 38 | 5.3 | 2.2 | \$119 |
| 2000 | 1.19 | 37 | 5.2 | 2.1 | \$114 |
| 1999 | 1.18 | 36 | 4.9 | 2.0 | \$106 |
| 1998 | 1.18 | 35 | 4.7 | 1.8 | \$101 |
| 1997 | 1.17 | 34 | 4.5 | 1.7 | \$97 |
| 1996 | 1.17 | 32 | 4.2 | 1.6 | \$93 |
| 1995 | 1.16 | 31 | 4.0 | 1.5 | \$87 |
| 1994 | 1.15 | 30 | 3.8 | 1.4 | \$82 |
| 1993 | 1.15 | 29 | 3.6 | 1.4 | \$77 |
| 1992 | 1.14 | 28 | 3.4 | 1.3 | \$73 |
| 1991 | 1.14 | 27 | 3.2 | 1.2 | \$69 |
| 1990 | 1.13 | 26 | 3.0 | 1.2 | \$65 |
| 1989 | 1.13 | 25 | 2.8 | 1.1 | \$62 |
| 1988 | 1.12 | 24 | 2.7 | 1.0 | \$58 |
| 1987 | 1.12 | 23 | 2.5 | 0.9 | \$55 |
| 1986 | 1.11 | 22 | 2.4 | 0.8 | \$52 |
| 1985 | 1.11 | 21 | 2.3 | 0.7 | \$51 |
| 1984 | 1.10 | 20 | 2.1 | 0.6 | \$48 |
| 1983 | 1.10 | 19 | 2.0 | 0.5 | \$45 |
| 1982 | 1.09 | 18 | 1.8 | 0.5 | \$42 |

Notes:
See Exhibit 1 for explanation of measures.
For more congestion information and for congestion information on your city, see Tables 1 to 4 and http://mobility.tamu.edu/ums.

# Turning Congestion Data Into Insight <br> (And the New Data Providing a More Accurate View) 

The 2015 Urban Mobility Scorecard is the $4^{\text {th }}$ that TTI and INRIX (2) have prepared. The data behind the 2015 Urban Mobility Scorecard are hundreds of speed data points on almost every mile of major road in urban America for almost every 15 -minute period of the average day of the week. For the congestion analyst, this means 900 million speeds on 1.3 million miles of U.S. streets and highways - an awesome amount of information. For the policy analyst and transportation planner, this means congestion problems can be described in detail, and solutions can be targeted with much greater specificity and accuracy.

Key aspects of the 2015 Urban Mobility Scorecard are summarized below.

- Congestion estimates are presented for each of the 471 U.S. urban areas. Improvements in the INRIX traffic speed data and the data provided by the states to the Federal Highway Administration (3) means that for the first time the Urban Mobility Scorecard can provide an estimate of the congestion effects on residents of every urban area. See Table 4 for a few 2014 congestion measures in each of the 370 urban areas that have not been intensively studied.
- Speeds collected by INRIX every 15 minutes from a variety of sources every day of the year on almost every major road are used in the study. The data for all 9615 -minute periods of the day makes it possible to track congestion problems for the midday, overnight and weekend time periods. For more information about INRIX, go to www.inrix.com.
- This data improvement created significant difference in congestion estimates compared with past Reports/Scorecards - more congestion overall, a higher percentage of congestion on streets and different congestion estimates for many urban areas. As has been our practice, past measure values were revised to provide our best estimate of congestion trends.
- More detail is provided on truck travel and congestion. Estimates of truck volume during the day were developed (in past reports, trucks were assumed to have the same patterns as cars travel). This changed delay and fuel estimates in different ways for several cities.
- The measure of the variation in travel time from day-to-day now uses a more representative tripbased process (4) rather than the old dataset that used individual road links. The Planning Time Index (PTI) is based on the idea that travelers want to be on-time for an important trip 19 out of 20 times; so one would be late to work only one day per month (on-time for 19 out of 20 work days each month). For example, a PTI value of 1.80 indicates that a traveler should allow 36 minutes to make an important trip that takes 20 minutes in low traffic volumes. The new values are lower, and closer to real-world experience.
- Many of the slow speeds that were formerly considered 'too slow to be a valid observation' are now being retained in the INRIX dataset. Experience and increased travel speed sample sizes have increased the confidence in the data.
- Where speed estimates are required, the estimation process is benefitting from the increased number of speeds in the dataset. The methodology is described on the mobility study website (5).

More information on the performance measures and data can be found at: http://mobility.tamu.edu/methodology/

## One Page of Congestion Problems

In the biggest regions and most congested corridors, traffic jams can occur at any hour, weekdays or weekends. The problems that travelers and shippers face include extra travel time, extra cost from wasted fuel and lost productivity and increasing unreliability where bad weather, roadwork, a malfunctioning traffic signal, a local event or a small accident or stalled vehicle can result in major delays. Some key measures are listed below. See data for your city at http://mobility.tamu.edu/ums/congestion data.

Congestion costs are increasing. The congestion "invoice" for the cost of extra time and fuel in the 471 U.S. urban areas was (all values in constant 2014 dollars):

- In 2014-\$160 billion
- In 2000-\$114 billion
- In 1982 - $\$ 42$ billion

Congestion wastes a massive amount of time, fuel and money. In 2014:

- 6.9 billion hours of extra time (more than the time it would take to drive to Pluto and back, if there was a road).
- 3.1 billion gallons of wasted fuel (more than 90 minutes worth of flow in the Missouri River).
- ...and if all that isn't bad enough, folks making important trips had to plan for nearly $21 / 2$ times as much travel time as in light traffic conditions in order to account for the effects of unexpected crashes, bad weather, special events and other irregular congestion causes.

## Congestion is also a type of tax

- $\$ 160$ billion of delay and fuel cost (the negative effect of uncertain or longer delivery times, missed meetings, business relocations and other congestion-related effects are not included) (equivalent to the lost productivity, clinic visit and medication costs for 53 million cases of poison ivy).
- 18 percent ( $\$ 28$ billion) of the delay cost was the effect of congestion on truck operations; this does not include any value for the goods being transported in the trucks.
- The cost to the average auto commuter was $\$ 960$ in 2014 compared to an inflation-adjusted $\$ 400$ in 1982.

## Congestion affects people who travel during the peak period. The average auto commuter:

- Spent an extra 42 hours traveling in 2014 up from 18 hours in 1982.
- Wasted 19 gallons of fuel in 2014 - a week's worth of fuel for the average U.S. driver - up from 4 gallons in 1982.
- In areas with over one million persons, 2014 auto commuters experienced:
- an average of 63 hours of extra travel time
- a road network that was congested for 6 hours of the average weekday
- had a congestion tax of $\$ 1,440$

## Congestion is also a problem at other hours.

- Approximately 41 percent of total delay occurs in the midday and overnight (outside of the peak hours) times of day when travelers and shippers expect free-flow travel.
- Many manufacturing processes depend on a free-flow trip for efficient production and congested networks interfere with those operations.

## More Detail About Congestion Problems

Congestion, by every measure, has increased substantially over the 33 years covered in this report. And almost every area has "recovered" from the economic recession; almost all regions have worse congestion than before the 2008 crash. Traffic problems as measured by per-commuter measures are about the same as a decade ago, but because there are so many more commuters, and more congestion during off-peak hours, total delay has increased by almost one billion hours. The total congestion cost has also risen with more wasted hours, greater fuel consumption and more trucks stuck in stop-and-go traffic.

Immediate solutions and long-term plans are needed to reduce undesirable congestion. The recession reduced construction costs, or at least slowed their growth. Urban areas and states can still take advantage of this situation - but each area must craft a set of programs, policies and projects that are supported by their communities. This mix will be different in every city, but all of them can be informed by data and trend information.

Congestion is worse in areas of every size - it is not just a big city problem. The growing delays also hit residents of smaller cities (Exhibit 3). Big towns and small cities have congestion problems - every economy is different and smaller regions often count on good mobility as a quality-of-life aspect that allows them to compete with larger, more economically diverse regions. As the national economy improves, it is important to develop the consensus on action steps -- major projects, programs and funding efforts take 10 to 15 years to develop.

Exhibit 3. Congestion Growth Trend - Hours of Delay per Auto Commuter

[^0]Large $=1$ million to 3 million Very Large $=$ more than 3 million

## Congestion Patterns

- Congestion builds through the week from Monday to Friday. The two weekend days have less delay than any weekday (Exhibit 4).
- Congestion is worse in the evening, but it can be a problem during any daylight hour (Exhibit 5).
- Midday hours comprise a significant share of the congestion problem.

Exhibit 4. Percent of Delay for Each Day

Exhibit 5. Percent of Delay for Hours of Day

## Congestion on Freeways and Streets

- Streets have more delay than freeways, but there are also many more miles of streets (Exhibit 6).
- Approximately 40 percent of delay occurs in off-peak hours.
- Freeway delay is much less of the problem in areas under 1 million population.

Exhibit 6. Percent of Delay - Road Type and Time of Day
Peak

Urban Areas Over
1M Population
Urban Areas Under 1M Population

## Rush Hour Congestion

- Severe and extreme congestion levels affected only 1 in 9 trips in 1982, but 1 in 4 trips in 2014.
- The most congested sections of road account for $80 \%$ of peak period delays, but only have $26 \%$ of the travel (Exhibit 7).

Exhibit 7. Peak Period Congestion in 2014

About 26\% of trips are in severe congestion.....

...but those worst trips
experience $80 \%$ of the extra travel time.

## Truck Congestion

- Trucks account for 18 percent of the urban "congestion invoice" although they only represent 7 percent of urban travel (Exhibit 8).
- The costs in Exhibit 8 do not include the extra costs borne by private companies who build additional distribution centers, buy more trucks and build more satellite office centers to allow them to overcome the problems caused by a congested and inefficient transportation network.

Exhibit 8. 2014 Congestion Cost for Urban Passenger and Freight Vehicles

Travel by Vehicle Type

Congestion Cost by Vehicle Type

## Since the Congestion Decline During the Recession ....

- American motorists are enduring about 5 percent more delay than the pre-recession peak in 2007. (Exhibit 2)
- While this is associated with a "good thing" -- economic and population growth in our major metro areas - it is also clear this growth is outpacing the investment in infrastructure and programs to address the increased demand on the network.
- Cities with employment and population growth faster than the national averages also experienced some of the biggest increases in traffic congestion.
- Cities that showed little to no change in traffic congestion were also those where employment and population growth was slower than the national average
- 53 of the 101 urban areas saw the total urban area delay exceed the pre-recession levels within 3 years; an immediate 'snapback' was seen in more than one-quarter of the studied regions.
- 22 areas still have lower total annual delay than in 2007/8. (Exhibit 9)
- In contrast to total delay, average auto commuter delay is still less than pre-recession levels in 60 areas
- Commuters in 16 areas saw the 'rapid snapback' - hours per commuter exceeding the 2007/8 values in 3 or fewer years. (Exhibit 8)

## Exhibit 9. Number of Years Before Congestion Returned to Pre-Recession Levels

## The Trouble With Planning Your Trip

We've all made urgent trips—catching an airplane, getting to a medical appointment, or picking up a child at daycare on time. We know we need to leave a little early to make sure we are not late for these important trips, and we understand that these trips will take longer during the "rush hour." The need to add extra time isn't just a "rush hour" consideration. Trips during the off-peak can also take longer than expected. If we have to catch an airplane at 1 p.m., we might still be inclined to add a little extra time, and the data indicate that our intuition is correct.

Exhibit 10 illustrates this problem. Say your typical trip takes 20 minutes when there are few other cars on the road. That is represented by the green bar across the morning, midday, and evening. Your trip usually takes longer, on average, whether that trip is in the morning, midday, or evening. This "average trip time" is shown in the solid yellow bar in Exhibit 10 - in 2014 the average big city auto commute was 25 minutes in the morning and 27 minutes in the evening peak.

Now, if you have to make a very important trip during any of these time periods there is additional "planning time" you must allow to reliably arrive on-time. And, as shown in Exhibit 10 (red bar), it isn't just a "rush hour" problem - it can happen any time of the day and amounts to an extra 29 minutes in the morning, 35 minutes in the evening and even 14 minutes for your 20-minute trip in the midday. The news isn't much better for those planning trips in areas with fewer than 1 million people - 14 and 18 minutes longer in the morning and evening peaks. Data for individual urban areas is presented in Table 3 (in the back of the report).

Exhibit 10. How Much Extra Time Should You Allow to Be 'On-Time'?

## The Future of Congestion

Before the economic recession, congestion was increasing at between 2 and 4 percent every year which meant that extra travel time for the average commuter increased slightly less than 1 hour every year. The economic recession set back that trend a few years, but the trend in the last few years indicates congestion is rising again. Congestion is the result of an imbalance between travel demand and the supply of transportation capacity - whether that is freeway lanes, bus seats or rail cars. As the number of residents or jobs goes up in an improving economy, or the miles or trips that those people make increases, the road and transit systems also need to, in some combination, either expand or operate more efficiently. As the rising congestion levels in this report demonstrate, however, this is an infrequent occurrence. Travelers are not only paying the price for this inadequate response, but traffic congestion can also become a drain on further economic growth.

As one estimate of congestion in the near future, this report uses the expected population growth and congestion trends from the period of sustained economic growth between 2000 and 2005 to get an idea of what the next five years might hold. The basic input and analysis features:

- The combined role of the government and private sector will yield approximately the same rate of transportation system expansion (both roadway and public transportation). The analysis assumes that policies and funding levels will remain about the same.
- The growth in usage of any of the alternatives (biking, walking, work or shop at home) will continue at the same rate.
- The period before the economic recession (from 2000 to 2005 ) was used as the indicator of the effect of growth. These years had generally steady economic growth in most U.S. urban regions; these years are assumed to be the best indicator of the future level of investment in solutions and the resulting increase in congestion for each urban area.

The congestion estimate for any single region will be affected by the funding, project selections and operational strategies; the simplified estimation procedure used in this report did not capture these variations. Using this simplified approach the following offers an idea of the national congestion problem in 2020.

- The national congestion cost will grow from $\$ 160$ billion to $\$ 192$ billion in 2020 (in 2014 dollars).
- Delay will grow to 8.3 billion hours in 2020.
- Wasted fuel will increase to 3.8 billion gallons in 2020.
- The average commuter's congestion cost will grow to $\$ 1,100$ in 2020 (in 2014 dollars).
- The average commuter will waste 47 hours and 21 gallons in 2020.

## Congestion Relief - An Overview of the Strategies

We recommend a balanced and diversified approach to reduce congestion - one that focuses on more of everything; more policies, programs, projects, flexibility, options and understanding. It is clear that our current investment levels have not kept pace with the problems. Most urban regions have big problems now - more congestion, poorer pavement and bridge conditions and less public transportation service than they would like.

There will be a different mix of solutions in metro regions, cities, neighborhoods, job centers and shopping areas. Some areas might be more amenable to construction solutions, other areas might use more technology to promote and facilitate travel options, operational improvements, or land use redevelopment. In all cases, the solutions need to work together to provide an interconnected network of smart transportation services as well as improve the quality-of-life.

There will also be a range of congestion targets. Many large urban areas, for example, use a target speed of 35 mph or 45 mph for their freeways; if speeds are above that level, there is not a 'congestion problem.' Smaller metro areas, however, typically decide that good mobility is one part of their quality-of-life goals, and have higher speed expectations. Even within a metro region, the congestion target will typically be different between downtown and the remote suburbs, different for freeways and streets, and different for rush hours than midday travel.

The level of congestion deemed unacceptable is a local decision. The Urban Mobility Scorecard uses one consistent, easily understood comparison level. But that level is not 'the goal,' it is only an expression of the problem. The Scorecard is only one of many pieces of information that should be considered when determining how much of the problem to solve.

Better data can play a valuable role in all of the analyses. Advancements in volume collection, travel speed data and origin to destination travel paths for people and freight allow transportation agencies at all government levels and the private sector to better identify existing chokepoints, possible alternatives and growth patterns. The solution begins with better understanding of the challenges, problems, possibilities and opportunities - where, when, how and how often mobility problems occur - and moves into similar questions about solutions - where, when, how can mobility be improved. These data will allow travelers to capitalize on new transportation services, identify novel programs, have better travel time reliability and improve their access to information.

More information on the possible solutions, places they have been implemented and the effects estimated in this report can be found on the website http://mobility.tamu.edu/solutions None of these ideas are the whole mobility solution, but they can all play a role.

- Get as much service as possible from what we have - Many low-cost improvements have broad public support and can be rapidly deployed. These operations programs require innovation, new monitoring technologies and staffing plans, constant attention and adjustment, but they pay dividends in faster, safer and more reliable travel. Rapidly removing crashed vehicles, timing the traffic signals so that more vehicles see green lights, and improving road and intersection designs are relatively simple actions. More complex changes such as traffic signals that rapidly adapt to different traffic patterns, systems that smooth traffic flow and reduce traffic collisions and
communication technologies that assist travelers (in all modes) and the transportation network in achieving goals are also a part of the 'get the best bang for the buck' approach.
- Add capacity in critical corridors - Handling more freight or person travel on freeways, streets, rail lines, buses or intermodal facilities often requires "more." Important corridors or growing regions can benefit from more street and highway lanes, new or expanded public transportation facilities, and larger bus and rail fleets. Some of the "more" will also be in the form of advancements in connected and autonomous vehicles - cars, trucks, buses and trains that communicate with each other and with the transportation network - that will reduce crashes and congestion.
- Provide choices - This might involve different travel routes, travel modes or lanes that involve a toll for high-speed and reliable service. These options allow travelers and shippers to customize their travel plans. There is much more transportation information available on websites, smartphones and apps, radio, TV and in their car or at their transit stop; the information involves displays of existing travel times, locations of roadwork or crashes, transit ridership and arrival information and a variety of trip planner resources. They allow travelers to make real-time decisions about when to depart on a trip, what route or mode to take, whether they are interested in paying a toll in order to guarantee an arrival time or perhaps just sleep in for a while and telecommute on a particularly bad day. In the past, this information was more difficult to find, tough to understand or was not updated very frequently. Today's commuters have much better information, delivered when and where its needed in a format they can use to make decisions
- Change the usage patterns - There are solutions that involve changes in the way employers and travelers conduct business to avoid traveling in the traditional "rush hours." Flexible work hours, internet connections or phones allow employees to choose work schedules that meet family needs and the needs of their jobs. These are not typically agency-led or agency-directed strategies - they are workers and managers getting together to identify virtuous combinations of work hours, commute modes, office space arrangements and electronic communication mechanisms. Companies have seen productivity increase when workers are able to adjust their hours and commute trips to meet family or other obligations. Those companies also save on parking space and office requirements and see less staff turnover and, therefore, lower recruiting and training costs.
- Diversify the development patterns - These typically involve denser developments with a mix of jobs, shops and homes, so that more people can walk, bike or take transit to more, and closer, destinations. Sustaining the quality-of-life and gaining economic development without the typical increment of congestion in each of these sub-regions appears to be part, but not all, of the mobility solution. Analytical advancements in fields of transportation, land development, education and other information sources mean that home purchasers have much more information about their commute options and the expectations they should have. A range of home types, locations and prices when matched with more information about, for example, historic travel times, elementary and secondary education quality, entertainment and cultural sites provides the type of information that consumers want.
- Realistic expectations are also part of the solution. Large urban areas will be congested. Some locations near key activity centers in smaller urban areas will also be congested. Identifying solutions and funding sources that meet a variety of community goals is challenging enough without attempting to eliminate congestion in all locations at all times. Congestion does not have to be an all-day event, and in many cases improving travel time awareness and predictability can be a positive first step towards improving urban mobility.

Case studies, analytical methods and data are available to support development of these strategies and monitor the effectiveness of deployments. There are also many good state and regional mobility reports that provide ideas for communicating the findings of the data analysis.

## Analysis Using the Best Congestion Data \& Analysis Methodologies

The base data for the 2015 Urban Mobility Scorecard came from INRIX, the U.S. Department of Transportation and the states $(2,3)$. Several analytical processes were used to develop the final measures, but the biggest improvement in the last two decades is provided by the INRIX data. The speed data covering most travel on most major roads in U.S. urban regions eliminates the difficult process of estimating speeds and dramatically improves the accuracy and level of understanding about the congestion problems facing US travelers.

The methodology is described in a technical report (5) that is posted on the mobility report website: http://mobility.tamu.edu/ums/methodology/.

- The INRIX traffic speeds are collected from a variety of sources and compiled in their Historical Profile database. Commercial vehicles, smart phones and connected cars with location devices feed time and location data points to INRIX.
- The proprietary process filters inappropriate data (e.g., pedestrians walking next to a street) and compiles a dataset of average speeds for each road segment. TTI was provided a dataset of $15-$ minute average speeds for each link of major roadway covered in the Historical Profile database (approximately 1.3 million miles in 2014).
- Traffic volume estimates were developed with a set of procedures developed from computer models and studies of real-world travel time and volume data. The congestion methodology uses daily traffic volume converted to 15 -minute volumes using a national traffic count dataset (6).
- The 15 -minute INRIX speeds were matched to the 15 -minute volume estimates for each road section on the FHWA maps.
- An estimation procedure was also developed for the sections of road that did not have INRIX data. As described in the methodology website, the road sections were ranked according to volume per lane and then matched with a similar list of sections with INRIX and volume per lane data (as developed from the FHWA dataset) (5).

# National Performance Measurement 

"What Gets Measured, Gets Done"

Many of us have heard this saying, and it is very appropriate when discussing transportation system performance measurement. Performance measurement at the national level is gaining momentum. Many state and local transportation agencies are implementing performance measurement activities to operate their systems as efficiently as possible with limited resources.

The Moving Ahead for Progress in the $21^{\text {st }}$ Century Act (MAP-21) was signed into law on July 6, 2012 to fund surface transportation. Among other aspects, MAP-21 establishes performance-based planning and programming to improve transportation decision-making and increase the accountability and transparency of the Federal highway funding program (7).

As part of the transition to a performance and outcome-based Federal highway funding program, MAP21 establishes national performance goals in the following areas (7):

- Safety
- Infrastructure condition
- Congestion reduction
- System reliability
- Freight movement and economic vitality
- Environmental sustainability
- Reduced project delivery delays

MAP-21 requirements provide the opportunity to improve agency operations. While transportation professionals will calculate the required MAP-21 performance measures, there is also an opportunity to develop processes and other measures to better understand their systems. The requirements of MAP21 are specified through a Rulemaking process. At the time of this writing, the Notice of Proposed Rulemaking (NPRM) for system performance measures (congestion, reliability) has not been released by the United States Department of Transportation (USDOT).

While the specific requirements of MAP-21 related to system performance measures are not yet known, the data, measures, and methods in the Urban Mobility Scorecard provide transportation professionals with a 33 -year trend of foundational knowledge to inform performance measurement and target setting at the urban area level. The measures and techniques have stood the test of time to communicate mobility conditions and potential solutions.

## "Don't Let Perfect be the Enemy of Good"

Occasionally there is reluctance at transportation agencies to dive in and begin performance measurement activities because there is a concern that the data or methods are just not good enough. Over the years, the Urban Mobility Report (and now the Scorecard) has taken advantage of data improvements - and associated changes in analysis methods - and the use of more powerful computational methods (for example, geographic information systems). Such adaptations are typical when conducting on-going performance reporting. As the successful 33 -year data trend of UMR/UMS suggests, changes can be made as improvements become available. The key is to get started!

## Concluding Thoughts

The national economy has improved since the last Urban Mobility Scorecard, and unfortunately congestion has gotten worse. This has been the case in the past, and it appears that the economycongestion linkage is as dependable as gravity. Some analysts had touted the decline in driving per capita and dip in congestion levels as a sign that traffic congestion would, in essence, fix itself. That is not happening.

The other seemingly dependable trend - not enough of any solution being deployed - also appears to be holding in most growing regions. That is really the lesson from this series of reports. The mix of solutions that are used is relatively less important than the amount of solution being implemented. All of the potential congestion-reducing strategies should be considered, and there is a role and location for most of the strategies.

- Getting more productivity out of the existing road and public transportation systems is vital to reducing congestion and improving travel time reliability.
- Businesses and employees can use a variety of strategies to modify their work schedules, traveling times and travel modes to avoid the peak periods, use less vehicle travel and increase the amount of electronic "travel."
- In growth corridors, there also may be a role for additional capacity to move people and freight more rapidly and reliably.
- Some areas are seeing renewed interest in higher density living in neighborhoods with a mix of residential, office, shopping and other developments. These places can promote shorter trips that are more amenable to walking, cycling or public transportation modes.

The 2015 Urban Mobility Scorecard points to national measures of the congestion problem for the 471 urban areas in 2014:

- $\$ 160$ billion of wasted time and fuel
- Including $\$ 28$ billion of extra truck operating time and fuel
- An extra 6.9 billion hours of travel and 3.1 billion gallons of fuel consumed The average urban commuter in 2014:
- spent an extra 42 hours of travel time on roads than if the travel was done in low-volume conditions
- used 19 extra gallons of fuel
- which amounted to an average value of $\$ 960$ per commuter

Traffic congestion has grown since the low point in 2009 during the economic recession. An additional 600 million hours and 700 million gallons of fuel were consumed in 2014 than in 2009. Congestion, in terms of average extra hours and gallons of fuel consumed by the average commuter, has not returned to pre-recession levels in 60 of the 101 urban areas that were intensively studied. But there have been increases in the extra hours of travel time and gallons those commuters suffer showing that the economic recession has not been a permanent cure for traffic congestion problems.

States and cities have been addressing the congestion problems they face with a variety of strategies and more detailed data analysis. Some of the solution lies in identifying congestion that is undesirable that which significantly diminishes the quality of life and economic productivity - and some lies in using the smart data systems and range of technologies, projects and programs to achieve results and communicate the effects to assure the public that their project dollars are being spent wisely.

## National Congestion Tables

Table 1. What Congestion Means to You, 2014

| Urban Area | Yearly Delay per Auto Commuter |  | Travel Time Index |  | Excess Fuel per Auto Commuter |  | Congestion Cost per Auto Commuter |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Hours | Rank | Value | Rank | Gallons | Rank | Dollars | Rank |
| Very Large Average (15 areas) | 63 |  | 1.32 |  | 27 |  | 1,433 |  |
| Washington DC-VA-MD | 82 | 1 | 1.34 | 8 | 35 | 1 | 1,834 | 1 |
| Los Angeles-Long Beach-Anaheim CA | 80 | 2 | 1.43 | 1 | 25 | 11 | 1,711 | 3 |
| San Francisco-Oakland CA | 78 | 3 | 1.41 | 2 | 33 | 3 | 1,675 | 4 |
| New York-Newark NY-NJ-CT | 74 | 4 | 1.34 | 8 | 35 | 1 | 1,739 | 2 |
| Boston MA-NH-RI | 64 | 6 | 1.29 | 17 | 30 | 4 | 1,388 | 9 |
| Seattle WA | 63 | 7 | 1.38 | 3 | 28 | 8 | 1,491 | 5 |
| Chicago IL-IN | 61 | 8 | 1.31 | 14 | 29 | 5 | 1,445 | 7 |
| Houston TX | 61 | 8 | 1.33 | 10 | 29 | 5 | 1,490 | 6 |
| Dallas-Fort Worth-Arlington TX | 53 | 11 | 1.27 | 19 | 22 | 23 | 1,185 | 14 |
| Atlanta GA | 52 | 12 | 1.24 | 25 | 20 | 44 | 1,130 | 22 |
| Detroit MI | 52 | 12 | 1.24 | 25 | 25 | 11 | 1,183 | 15 |
| Miami FL | 52 | 12 | 1.29 | 17 | 24 | 15 | 1,169 | 17 |
| Phoenix-Mesa AZ | 51 | 17 | 1.27 | 19 | 25 | 11 | 1,201 | 13 |
| Philadelphia PA-NJ-DE-MD | 48 | 22 | 1.24 | 25 | 23 | 18 | 1,112 | 26 |
| San Diego CA | 42 | 43 | 1.24 | 25 | 11 | 92 | 887 | 61 |

Very Large Urban Areas-over 3 million population.
Medium Urban Areas-over 500,000 and less than 1 million population.
Small Urban Areas-less than 500,000 population.
Yearly Delay per Auto Commuter-Extra travel time during the year divided by the number of people who commute in private vehicles in the urban area
Travel Time Index-The ratio of travel time in the peak period to the travel time at free-flow conditions. A value of 1.30 indicates a $20-\mathrm{minute}$ free-flow trip takes 26 minutes in the peak period.
Excess Fuel Consumed-Increased fuel consumption due to travel in congested conditions rather than free-flow conditions.
Congestion Cost-Value of travel time delay (estimated at $\$ 17.67$ per hour of person travel and $\$ 94.04$ per hour of truck time) and excess fuel consumption (estimated using state average cost per gallon for gasoline and diesel)
Note: Please do not place too much emphasis on small differences in the rankings. There may be little difference in congestion between areas ranked (for example) $6^{\text {ln }}$ and $12^{\text {n. }}$. The actual measure values should also be examined. The best congestion comparisons are made between similar urban areas.

Table 1. What Congestion Means to You, 2014, Continued

| Urban Area | Yearly Delay per Auto Commuter |  | Travel Time Index |  | Excess Fuel per Auto Commuter |  | Congestion Cost per Auto Commuter |  |

Very Large Urban Areas-over 3 million population.
Large Urban Areas-over 1 million and less than 3 million population.
Travel Delay-Extra travel time during the year.
Excess Fuel Consumed-Value of increased fuel consumption due to travel in congested conditions rather than free-flow conditions (using state average cost per gallon)
Truck Congestion Cost-Value of increased travel time and other operating costs of large trucks (estimated at $\$ 94.04$ per hour of truck time) and the extra diesel consumed (using state average cost per gallon).
Congestion Cost-Value of delay and fuel cost (estimated at $\$ 17.67$ per hour of person travel, $\$ 94.04$ per hour of truck time and state average fuel cost).
Note:Please do not place too much emphasis on small differences in the rankings. There may be little difference in congestion between areas ranked (for example) $6^{\text {th }}$ and $12^{\text {th }}$. The actual measure values should also be examined. The best congestion comparisons are made between similar urban areas.

Table 2. What Congestion Means to Your Town, 2014, Continued

| Very Large Average (15 areas) | 3.06 |  | 1.37 |  | 1.44 |  |
| Los Angeles-Long Beach-Anaheim CA | 3.75 | 1 | 1.57 | 1 | 1.63 | 2 |
| Washington DC-VA-MD | 3.48 | 2 | 1.40 | 10 | 1.52 | 7 |
| Seattle WA | 3.41 | 4 | 1.47 | 5 | 1.59 | 4 |
| San Francisco-Oakland CA | 3.30 | 6 | 1.49 | 4 | 1.64 | 1 |
| Chicago IL-IN | 3.16 | 10 | 1.39 | 11 | 1.45 | 17 |
| New York-Newark NY-NJ-CT | 3.15 | 11 | 1.38 | 13 | 1.44 | 18 |
| Houston TX | 3.13 | 12 | 1.43 | 7 | 1.47 | 13 |
| Miami FL | 2.85 | 15 | 1.28 | 21 | 1.30 | 78 |
| Boston MA-NH-RI | 2.81 | 17 | 1.38 | 13 | 1.47 | 13 |
| Detroit MI | 2.80 | 18 | 1.26 | 23 | 1.28 | 80 |
| Phoenix-Mesa AZ | 2.66 | 21 | 1.24 | 28 | 1.34 | 64 |
| San Diego CA | 2.66 | 21 | 1.25 | 26 | 1.32 | 75 |
| Dallas-Fort Worth-Arlington TX | 2.65 | 23 | 1.34 | 18 | 1.38 | 49 |
| Atlanta GA | 2.48 | 30 | 1.25 | 26 | 1.34 | 64 |
| Philadelphia PA-NJ-DE-MD | 2.41 | 33 | 1.19 | 32 | 1.25 | 84 |

Very Large Urban Areas-over 3 million population.
Medium Urban Areas-over 500,000 and less than 1 million population.
Small Urban Areas-less than 500,000 population.
Freeway Planning Time Index-A travel time reliability measure that represents the total travel time that should be planned for a trip to be late for only 1 work trip per month. A PTI of 2.00 means that 40 minutes should be planned for a 20 -minute trip in light traffic ( 20 minutes $\times 2.00=40$ minutes)
Freeway Travel Time Index-The ratio of travel time in the peak period to the travel time at low volume conditions. A value of 1.30 indicates a 20 -minute free-flow trip takes 26 minutes in the peak period ( 20 minutes $\times 1.30=26$ minutes). Note that the TTI reported in Table 3 is only for freeway facilities to compare to the freeway-only PTI values.
Freeway Commuter Stress Index - The travel time index calculated for only the peak direction in each peak period (a measure of the extra travel time for a commuter).
Note: Please do not place too much emphasis on small differences in the rankings. There may be little difference in congestion between areas ranked (for example) $6^{\text {th }}$ and $12^{\text {th }}$. The actual measure values should also be examined.

Table 3. How Reliable is Freeway Travel in Your Town, 2014, Continued

| Urban Area | Freeway Planning Time Index |  | Freeway Travel Time Index |  | Freeway Commuter Stress Index |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^5]Large Urban Areas-over 1 million and less than 3 million population.
Medium Urban Areas-over 500,000 and less than 1 million population.
Small Urban Areas-less than 500,000 population.
Freeway Planning Time Index-A travel time reliability measure that represents the total travel time that should be planned for a trip to be late for only 1 work trip per month. A PTI of 2.00 means that 40 minutes should be planned for a 20 -minute trip in light traffic ( 20 minutes $\times 2.00=40$ minutes).
Freeway Travel Time Index-The ratio of travel time in the peak period to the travel time at low volume conditions. A value of 1.30 indicates a 20 -minute free-flow trip takes 26 minutes in the peak period ( 20 minutes $\times 1.30=26$ minutes). Note that the TTI reported in Table 3 is only for freeway facilities to compare to the freeway-only PTI values
Freeway Commuter Stress Index - The travel time index calculated for only the peak direction in each peak period (a measure of the extra travel time for a commuter):
Note: Please do not place too much emphasis on small differences in the rankings. There may be little difference in congestion between areas ranked (for example) $6^{\text {ti }}$ and $12^{\text {th }}$. The actual measure values should also be examined.

[^0]:    Small = less than 500,000
    Medium $=500,000$ to 1 million

[^1]:    arge Urban Areas-over 1 million and less than 3 million population.
    Yearly Delay per Auto Commuter-Extra travel time during the year divided by the number of people who commute in private vehicles in the urban area.

[^2]:    Medium Urban Areas-over 500,000 and less than 1 million population.

[^3]:    Very Large Urban Areas-over 3 million population.

[^4]:    Travel Delay-Extra travel time during the year.
    Excess Fuel Consumed-Value of increased fuel consumption due to travel in congested conditions rather than free-flow conditions (using state average cost per gallon).

[^5]:    Very Large Urban Areas-over 3 million population.

[^6]:    Very Large Urban Areas-over 3 million population.
